Van Veen Grabs

Description

Van Veen Grabs are a simple and reliable way to collect samples from the top sediment layers of sea, lake and river beds, for chemical analyses, biological studies, hydrological surveys and environmental monitoring. Lightweight and portable, our Van Veen Grabs are available in three sizes.

All models have access flaps in the bucket tops to enable sampling of the sediment before the buckets are emptied. Lead weights can also be mounted on the grabs, enabling deployment in strong currents and assisting sampling of compact sediments.

EEL

Van Veen Grabs

Available grabs

Grab	Bare weight	Sample
0.045m ²	8 kg	2.75 L
0.1m ²	26.5 kg	12 L
Double 0.1m ²	52 kg	2x 12 L
